Problem-Solution Fit

Date	2 July 2026
Team ID	xxxxxx
Project Name	A Comprehensive Measure of Well-Being
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

Use the framework below to ensure your proposed solution accurately addresses the root causes, behaviors, and limitations of your target audience.

1. CUSTOMER SEGMENT(S) [CS]	6. CUSTOMER LIMITATIONS [CL]	5. AVAILABLE SOLUTIONS PROS & CONS [AS]
• Policymakers: Government officials planning national budgets and development goals. **• Researchers: Academics studying global economic and social disparities.** **• Students/Analysts: University students and data analysts working on socio-economic projects.**	• **Technical Skills:** Policymakers and students often lack advanced programming skills (Python/R) to process raw data. • **Budget:** Limited funds for expensive, enterprise-grade Business Intelligence (BI) or statistical software. • **Devices/Connectivity:** Reliance on standard laptops; users in developing regions may have intermittent internet access.	**Current Solutions:** UNDP Static Reports, Manual Excel Calculations, SPSS/R. **Pros:** Highly accurate, officially recognized, comprehensive historical data. **Cons:** Completely static (no real-time "what-if" analysis), steep learning curve for statistical software, highly time-consuming to update and model manually.
2. PROBLEMS / PAINS + FREQUENCY [PR]	**9. PROBLEM ROOT / CAUSE [RC]**	**7. BEHAVIOR + INTENSITY [BE]**
• Pain: Inability to instantly simulate how changes in specific sectors (e.g., increasing education funding) will shift a	The core issue is the **lack of accessible, interactive, and real-time predictive tools** that translate raw, multi-dimensional socio-economic data into actionable HDI	• **Behavior:** Users manually download massive CSV datasets from the World Bank/UNDP, spend

country's overall HDI tier. **• Pain: Manual calculation of the HDI geometric mean is tedious and prone to human error.** **• Frequency: High – Occurs frequently during national budget planning, policy drafting, and academic research cycles.**	insights without requiring advanced data science or programming expertise.	hours cleaning data in Excel, manually apply complex HDI formulas, and create static charts. **• Intensity: High effort, high time investment, low agility.** Users are stuck in a repetitive, manual data-processing loop.
3. TRIGGERS TO ACT [TR]	**10. YOUR SOLUTION [SL]**	**8. CHANNELS OF BEHAVIOR [CH]**
• Need to draft a new national development policy or justify budget allocations. **• Requirement to publish a research paper or complete a university data analysis project.** **• Release of new annual UNDP Human Development Reports prompting updated comparative analysis.**	An **interactive, web-based Machine Learning application** (built with Flask & Scikit-learn) that allows users to input or upload country indicators (Life Expectancy, Education, GNI) to instantly predict the HDI score and tier (Very High to Low), complete with intuitive data visualizations.	**ONLINE:** • World Bank / UNDP Open Data portals (downloading raw data). • Web browsers accessing our Flask Web App. • Excel / SPSS for manual processing. **OFFLINE:** • Policy planning meetings and government boardrooms. • Academic classrooms and research presentations.
4. EMOTIONS BEFORE / AFTER [EM]		
Before: Overwhelmed by complex datasets, anxious about making incorrect policy decisions based on outdated static reports, frustrated by the time-consuming nature of manual calculations. **After: Confident in data-driven decision-making, relieved by automated and instant calculations, empowered by interactive visualizations and scenario modeling.**
